

## SUPPLEMENTAL INFORMATION

# Grazing for Bog Turtle (*Glyptemys muhlenbergii*) Habitat Management: Case Study of a New York Fen

KRISTEN BELL TRAVIS, ERIK KIVIAT, JASON TESAURO, LEA STICKLE, MELISSA FADDEN,  
VERONICA STECKLER, AND LAURA LUKAS

The following material is provided by the authors and was not subjected to peer review or editing by *Herpetological Conservation and Biology*.

**APPENDIX A.** Vegetation plot variables, descriptive statistics, and box plots of selected variables by year at New York bog turtle study site.

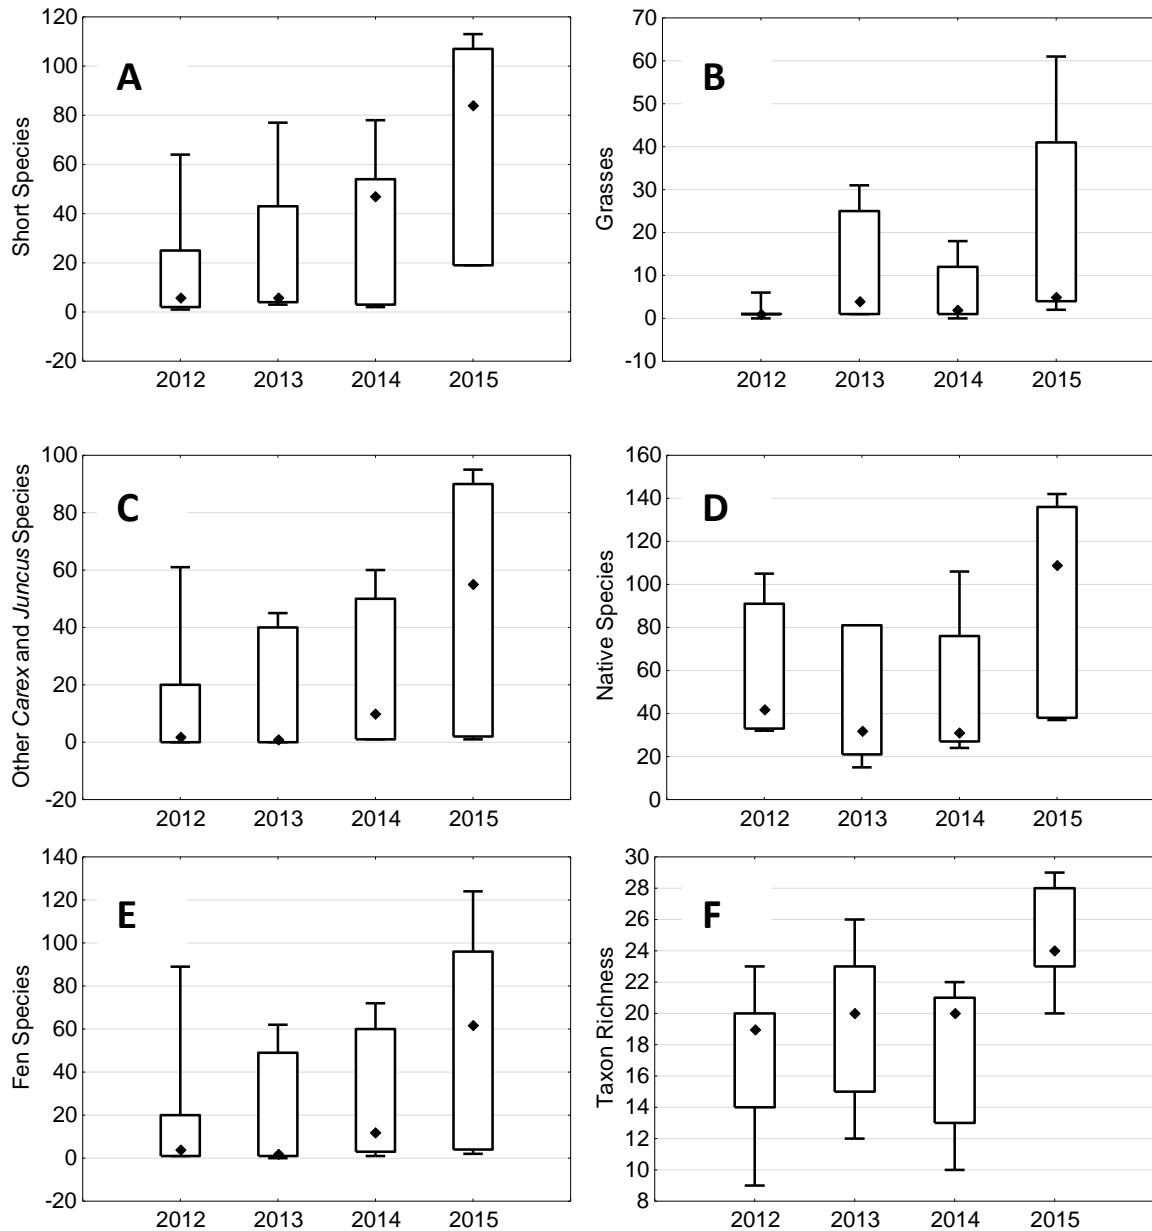

**TABLE A1.** Definitions of the composite vegetation variables and explanation of abbreviations for selected prominent individual species. Astsol (asters plus goldenrods) and Carjun (most sedges and rushes) were recorded as such because it was not feasible to separate species during plot sampling in July when many species were immature. Mean, median, minimum, and maximum percent cover values include data from 10 plots in all years sampled (3-5 years, n = 41), all in the West Paddock grazing treatment area. (Quantitative analyses in results section and graphs in figures A1-A2 were based on a subset of these, the seven plots with data from 2012-2015.) Because plots were located within different habitat types (rich fen, wet meadow, shrub swamp) within the core wetland, these percent cover values characterize the whole wetland rather than a single habitat. Total cover values in a plot can sum to > 100% because of vertical overlap of plant structures.

Variable	Definition	Mean	Median	Minimum	Maximum
Richness	Total number of taxa (as recorded separately in sampling)	21.2	21	9	37
xTallest	Mean of stretched lengths of the three longest plants in a plot (cm)	144.4	147	74	196
TOTShrub	Total shrub cover (sum of cover values for all shrub species)	3.5	1	0	27
TOTGrass	Total grass cover (sum of cover values for all grass species)	9.5	4	0	61
SEDGERUSH	Total sedge and rush cover (sum of all cover values for all <i>Carex</i> and <i>Juncus</i> )	24.4	12	0	105

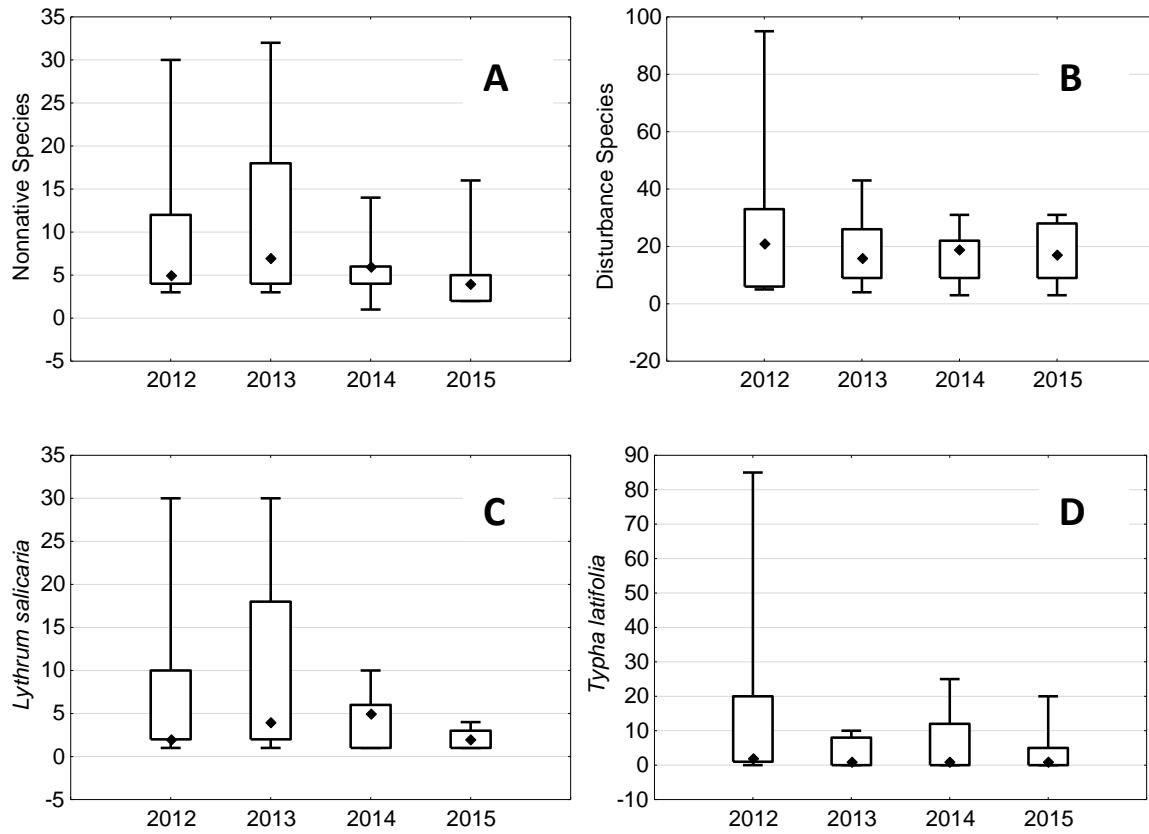

(continued)

Table A1, cont.

<b>Variable</b>	<b>Definition</b>	<b>Mean</b>	<b>Median</b>	<b>Minimum</b>	<b>Maximum</b>
Carjun	Cover of <i>Carex</i> (other than <i>C. stricta</i> ) and <i>Juncus</i> (other than <i>J. effusus</i> and <i>J. tenuis/dudleyi</i> )	20.8	4	0	95
TOTShort	Total cover of short species (sum of cover values for those species usually < 1 m tall)	38.7	25	1	115
TOTTall	Total cover of tall species (sum of cover values for those species usually > 1 m tall)	38.8	35	7	100
TOTNative	Total cover of native species (sum of cover values for unambiguously native species)	59.5	43	14	146
TOTIntrod	Total cover of introduced species (sum of cover values for unambiguously nonnative species)	9.9	6	1	60
TOTFen	Total fen species cover (sum of cover values for all species typical of fens)	25.7	10	0	124
TOTDist	Total disturbance species cover (sum of cover values for all species typical of disturbed soil in fens)	22.4	19	3	95
TOTNFW	Total non-fen woody cover (sum of cover values for all woody plants not typical of fens)	1.8	1	0	25
Astsol	Total cover of asters ( <i>Aster</i> s.l. spp.) plus goldenrods ( <i>Solidago</i> spp. other than <i>S. patula</i> )	10.7	5	0	85
Dasfru	<i>Dasiphora fruticosa</i> (shrubby cinquefoil) cover	2.2	0	0	30
Eupmac	<i>Eutrochium maculatum</i> (spotted Joe Pye weed) cover	2.3	1	1	10
Impcap	<i>Impatiens capensis</i> (spotted jewelweed) cover	1.5	1	0	15
Lycopus	<i>Lycopus</i> spp. (water-horehound) cover	1.0	1	0	4
Lytsal	<i>Lythrum salicaria</i> (purple loosestrife) cover	7.8	3	1	60
Solpat	<i>Solidago patula</i> (spreading goldenrod) cover	0.4	0	0	2
Typlat	<i>Typha latifolia</i> (Broad-leaved Cattail) cover	6.9	2	0	85

**FIGURE A1.** Median percent cover of groups of plant species (cover of each species added together, so totals may exceed 100%; A-E) and median taxon richness (number of species or genera recorded; F) in vegetation plots 1-7 (West Paddock) in 2012-2015. All graphs were prepared from raw data; all variables showed significant differences at  $\alpha = 0.05$  (values reported in text; all  $n = 7$ ,  $df = 3$ ). Boxes represent 1<sup>st</sup> and 3<sup>rd</sup> quartile; whiskers depict total range.

**FIGURE A2.** Median percent cover of groups of nonnative and disturbance-associated plant species (cover of each species added together, so totals may exceed 100%; A, B) and of two disturbance-associated species (*L. salicaria* is also nonnative; C, D) in vegetation plots 1-7 (West Paddock) in 2012-2015. A-C showed no significant differences at  $\alpha = 0.05$ ; D was significantly different (values reported in text; all  $n = 7$ ,  $df = 3$ ). Boxes represent 1<sup>st</sup> and 3<sup>rd</sup> quartile; whiskers depict total range.

**APPENDIX B.** Vascular flora of the study site. This list is principally from the core habitat; species found outside are indicated with an asterisk (\*). Nomenclature and native (n) or introduced (i) status follow USDA (2015); we have used regional common names where available. We subjectively ranked abundance at the site for each year of study: Rar = Rare, Unc = Uncommon, Com = Common, Abd = Abundant, LC = Locally common, LA = Locally abundant. Species marked with number sign (#) were represented by only one or two plants. Species difficult to distinguish in the field (e.g., goldenrods, *Carex* sedges) were not specifically ranked and question marks (?) are in the Rank columns.

There were apparent increases in Yellow Sedge (*Carex flava*), Field Horsetail (*Equisetum arvense*), and Spotted Joe Pye Weed (*Eutrochium maculatum*). There were apparent decreases in Red-osier Dogwood (*Cornus sericea*) and the tall nonnative forb Hairy Willow-herb (*Epilobium hirsutum*). Red-osier appeared to be browsed heavily by the cattle. The spike-rush *Eleocharis erythropoda* increased during the three years of grazing then decreased in the fourth, non-grazed, year. Our ranking of other plant species did not vary enough to indicate changes in abundance.

<i>Viburnum dentatum</i> var. <i>lucidum</i>	Northern Arrowwood	n	Rar	Rar?	Rar	Rar?
<i>Viola ?affinis</i>	Sand Violet	n	(3)	?	(3)	(3)
<i>Viola cucullata</i> or <i>V. × bisselii</i>	Marsh Blue Violet	n	(3)	?	(3)	(3)
<i>Viola cucullata</i>	Marsh Blue Violet	n	(3)	?	(3)	(3)
<i>Viola nephrophylla</i>	Northern Bog Violet	n	(3)	?	(3)	(3)
<i>Vitis riparia</i>	Riverbank Grape	n	Rar?	Rar?	Rar?	Rar?
<i>Zizia aptera</i>	Meadow Zizia	n	Not found	Not found	Not found	Rar

(1) *Lycopus* spp. were probably collectively Unc-Com (increasing during study)

(2) *Pilea* spp. were probably collectively Unc but Com-Abd in 2015

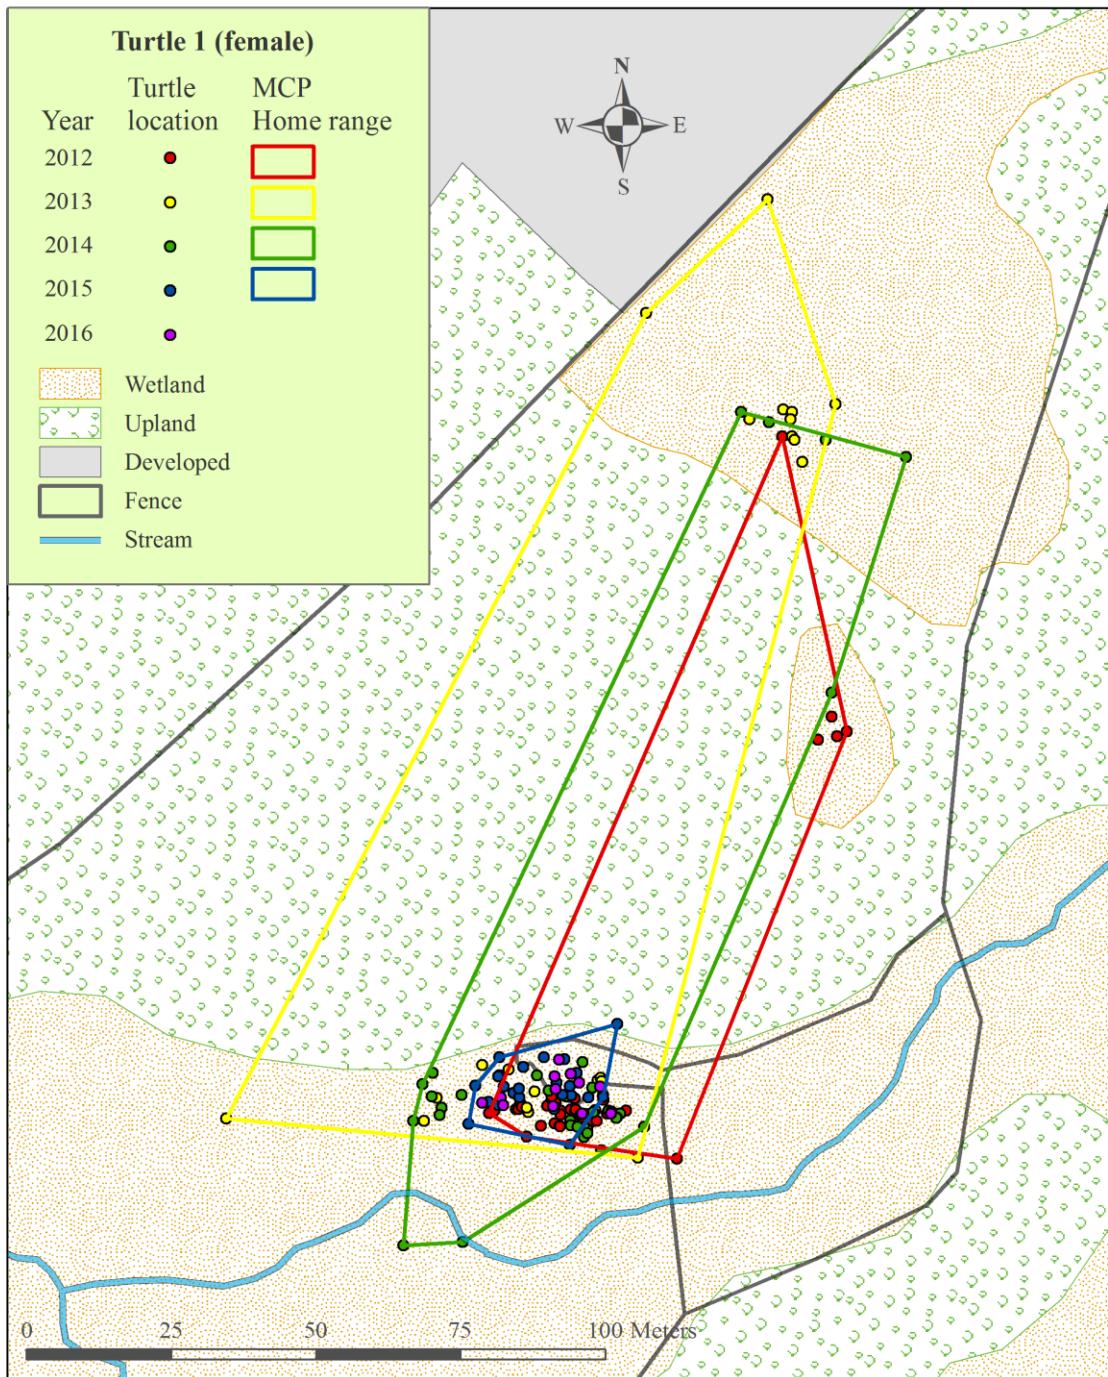

(3) The blue violets were collectively Unc or Rar

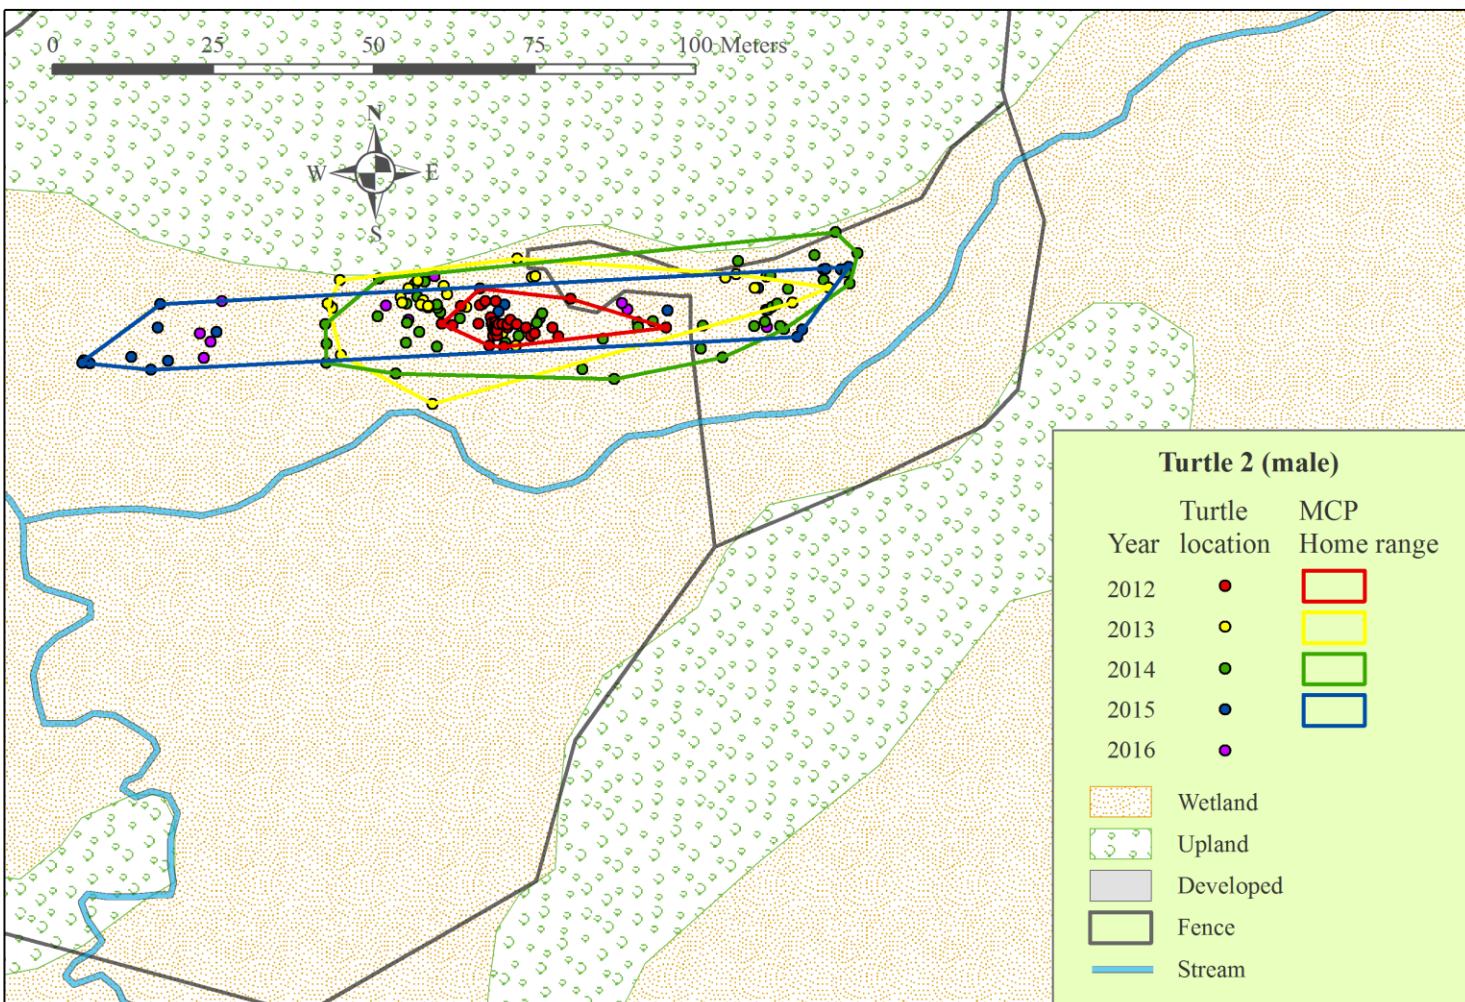

(4) *Glyceria* spp. collectively Unc-Rar

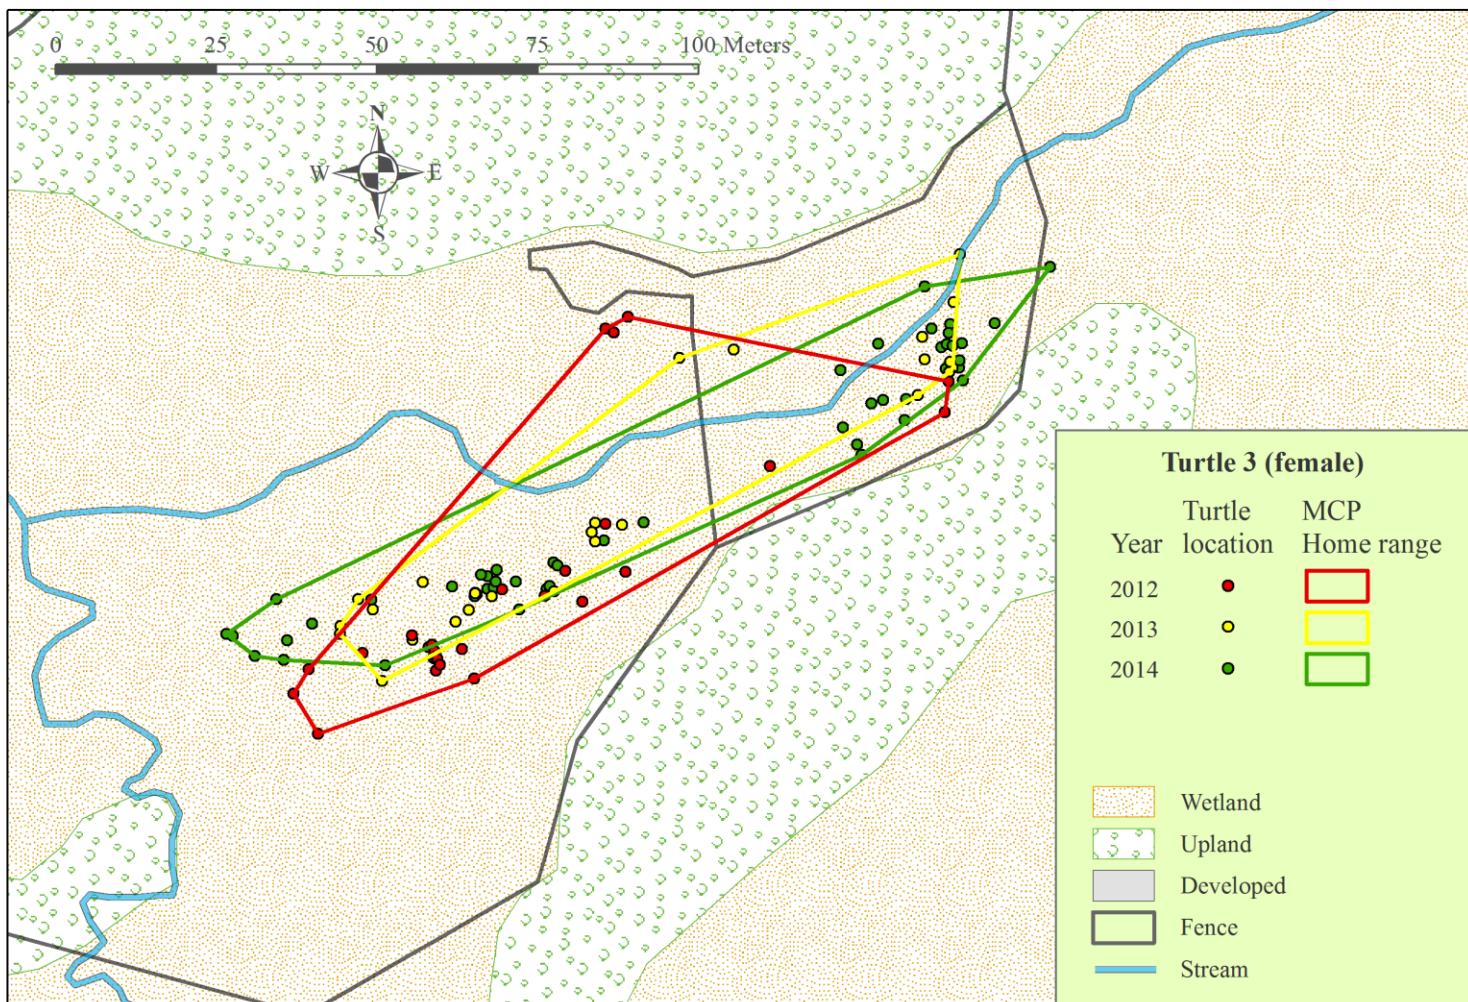

**APPENDIX C.** Mann-Whitney U tests of soil variables at Turtle locations and random Cattail locations (see Fig. 1 for sampling locations). Rank sums show which group (Turtle vs. Cattail) has higher values of the variable. The null hypothesis is no difference in values between Turtle and Cattail. We set alpha = 0.1 because of the small sample size. The bolded variables (first set) are statistically significant ( $p < 0.1$ ) and the values in the Turtle and Cattail groups do not overlap. Concentrations of toxic elements do not seem high enough to be a threat to the turtles.

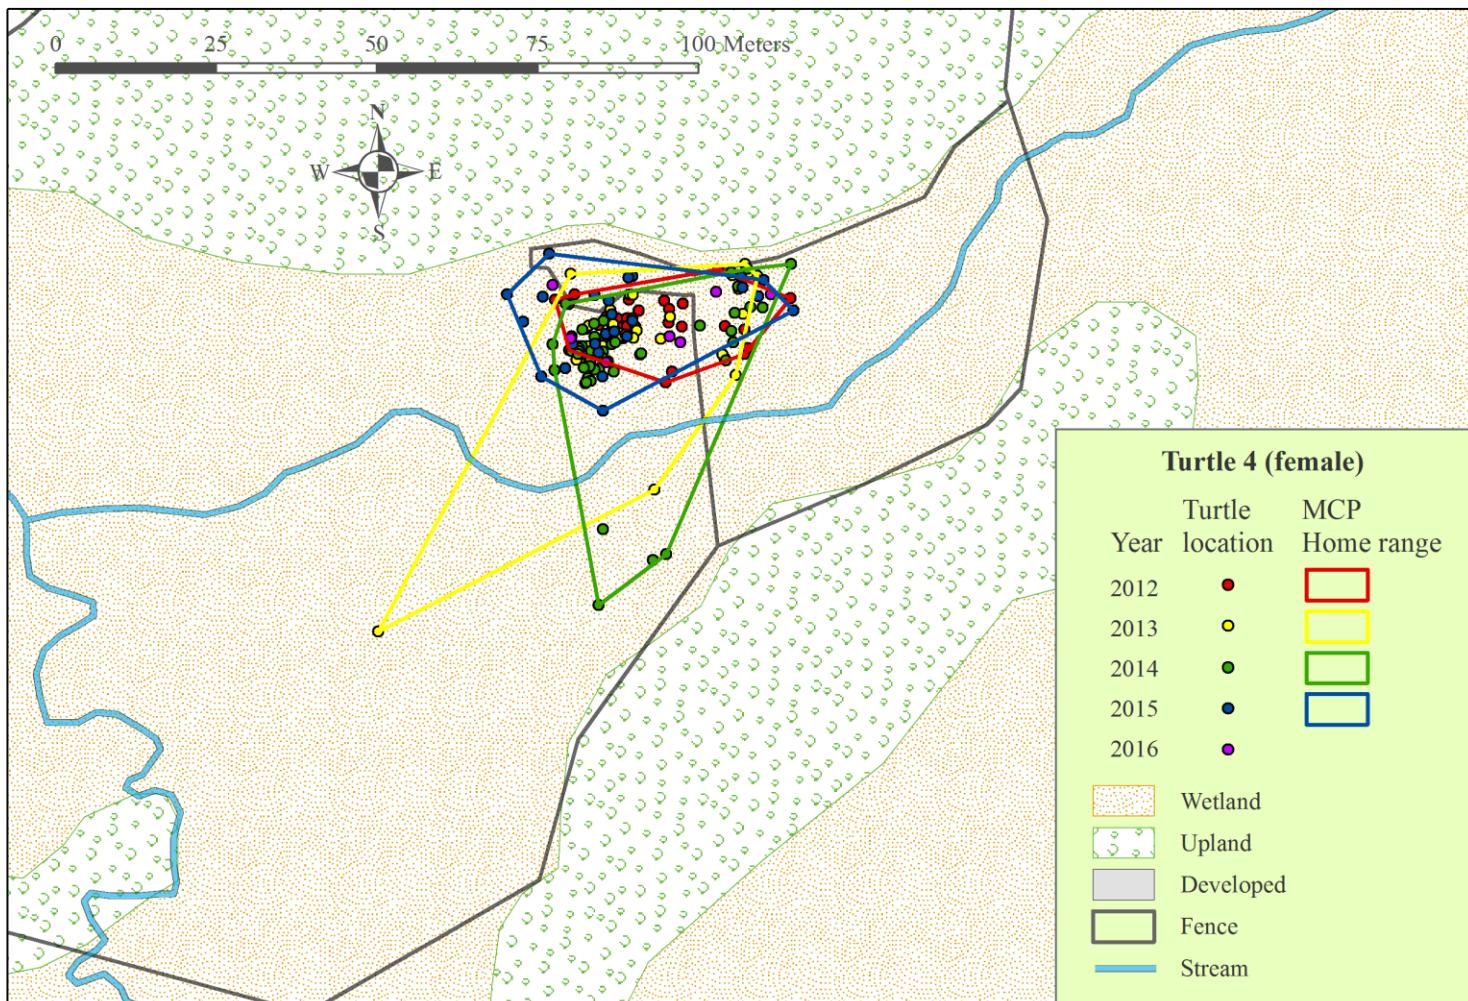

Variable	Rank sum turtle	Rank sum cattail	U	p
<b>Arsenic</b>	22	6	0.0	<b>0.057</b>
<b>Boron</b>	22	6	0.0	<b>0.057</b>
<b>Bulk Density (dry g/mL)</b>	10	18	0.0	<b>0.057</b>
<b>Calcium</b>	22	6	0.0	<b>0.057</b>

**APPENDIX D.** Locations of individual bog turtles radio-tracked across years at the New York study site, and minimum convex polygon (MCP) home ranges for each year. No home ranges were calculated for 2016 since tracking ended in early July.

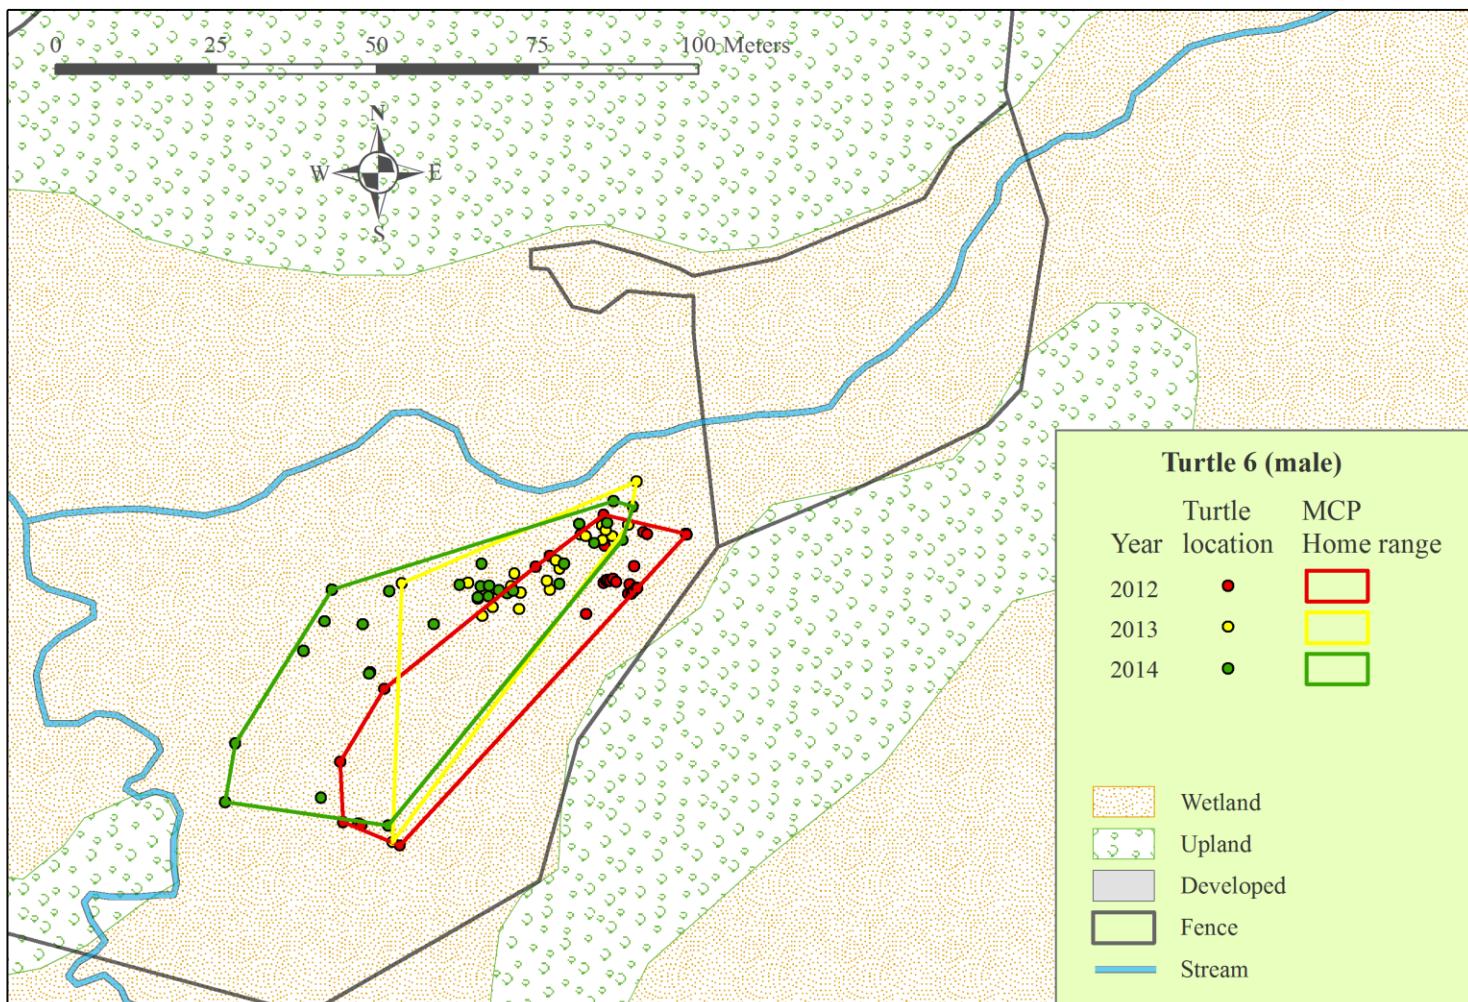

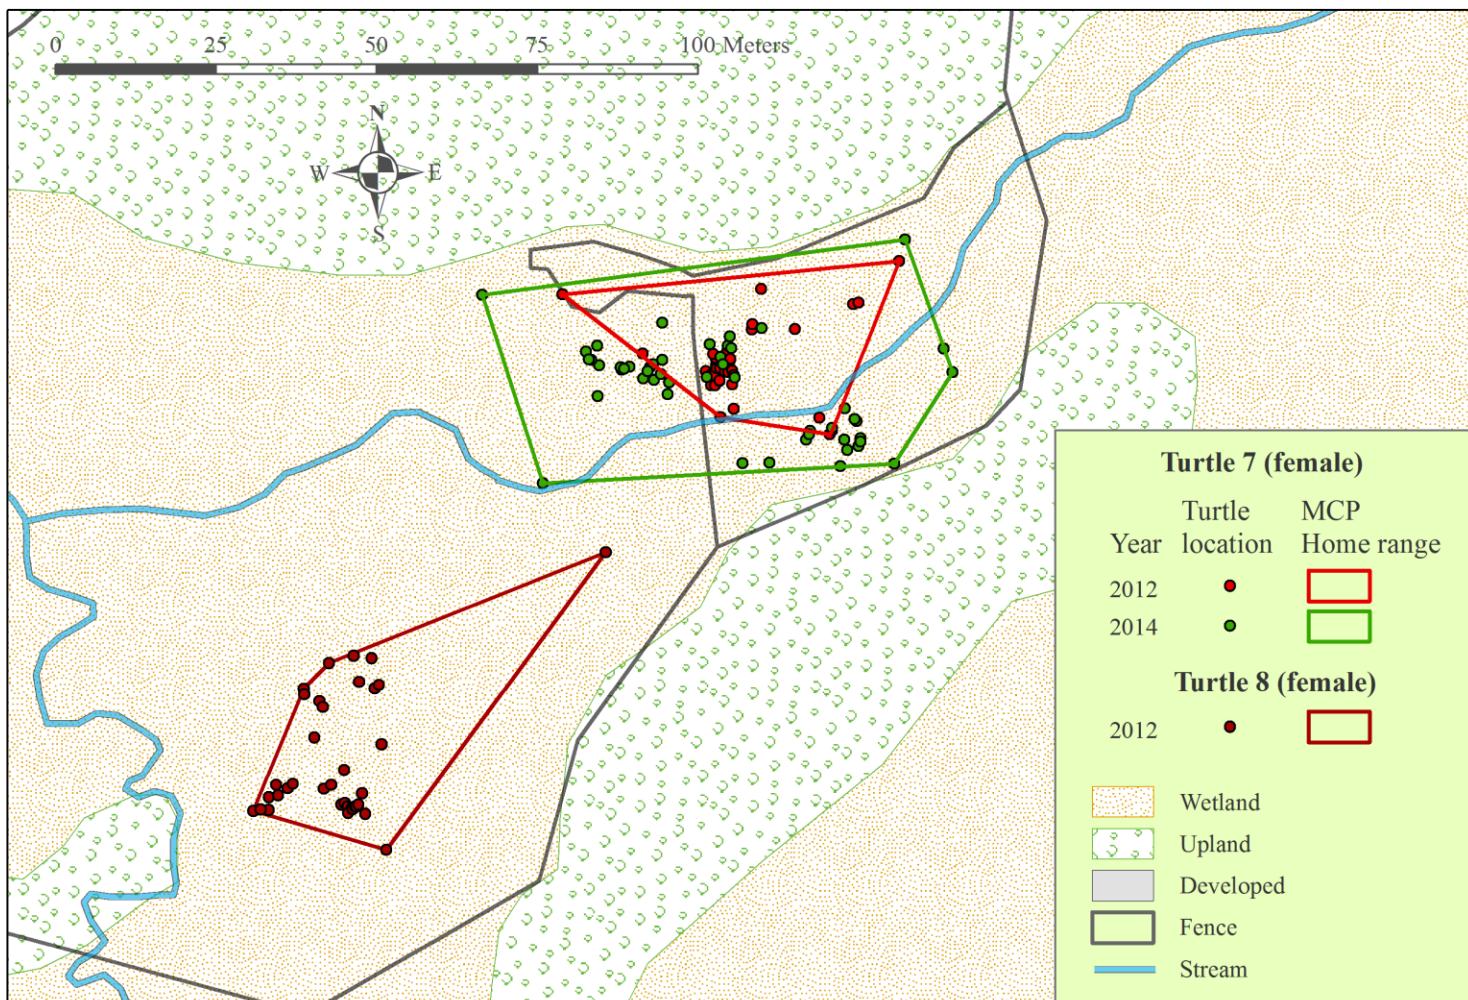

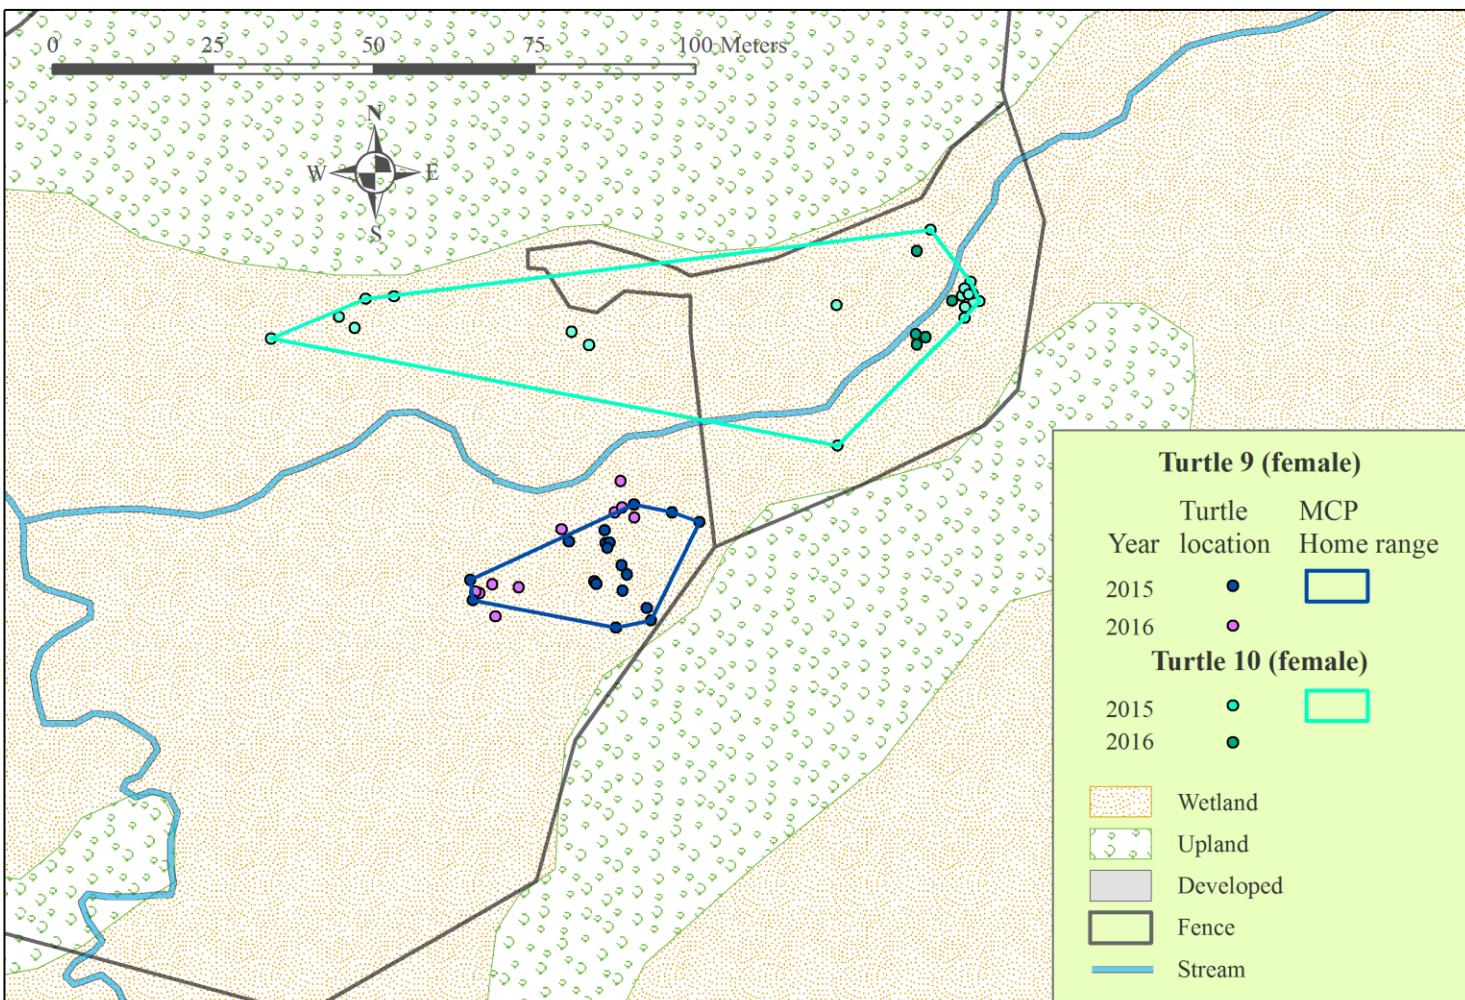

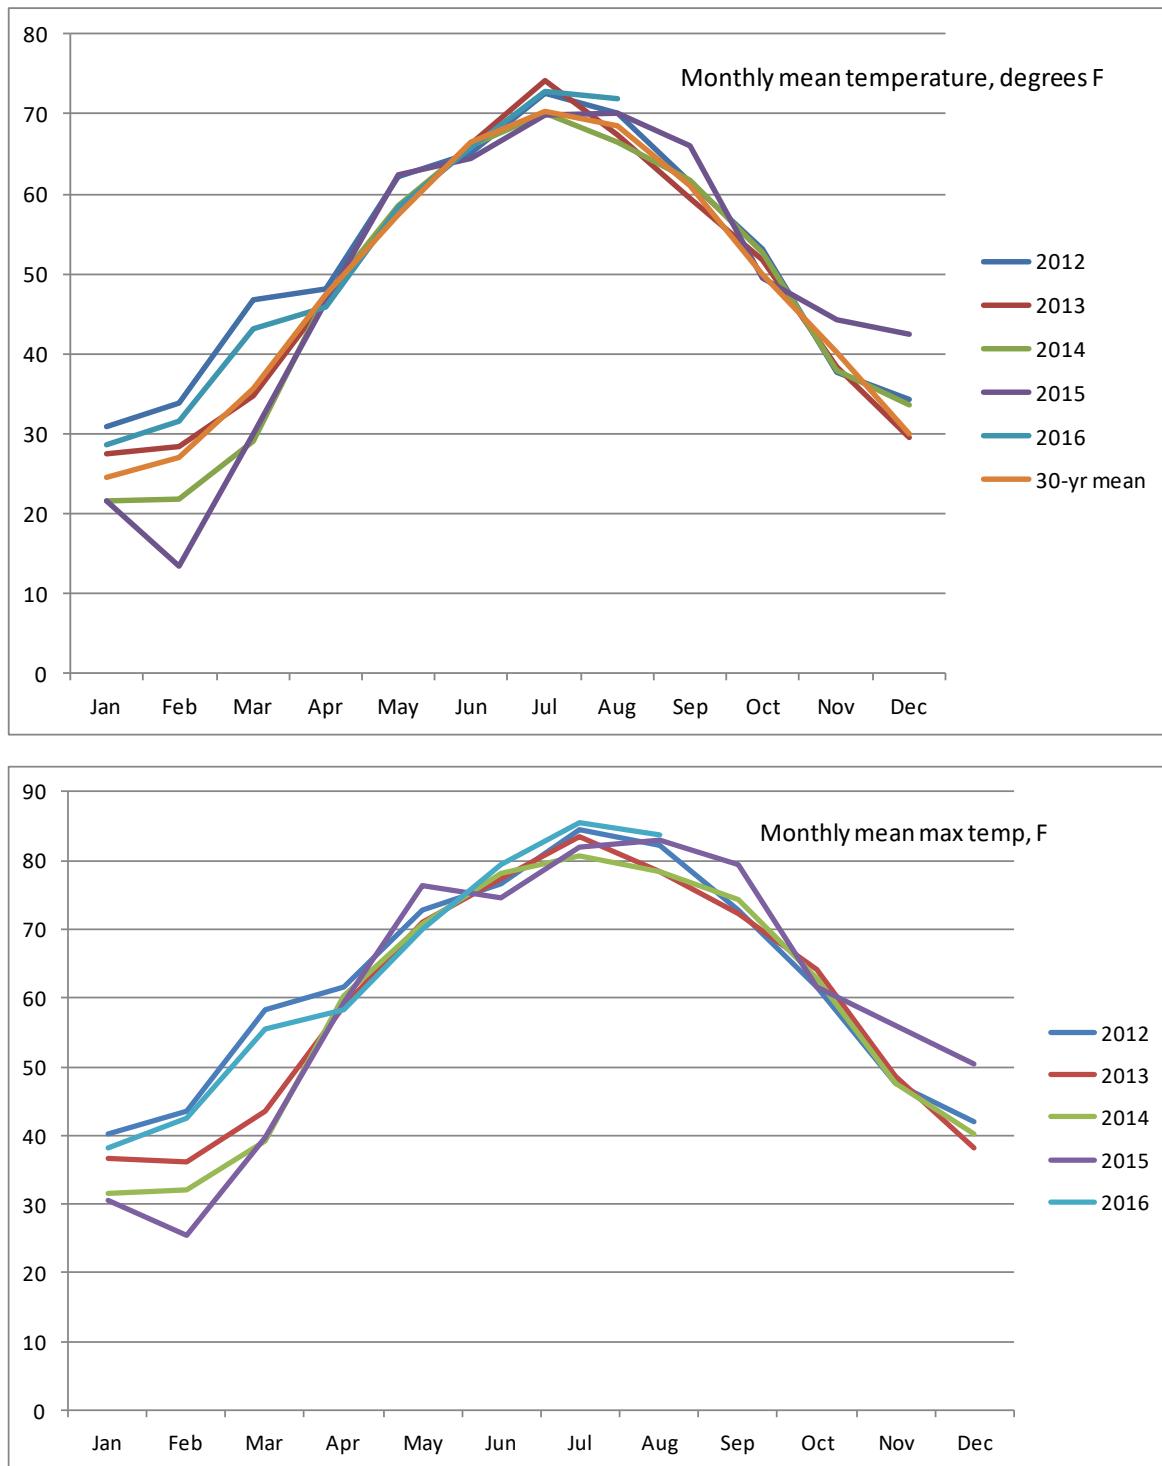

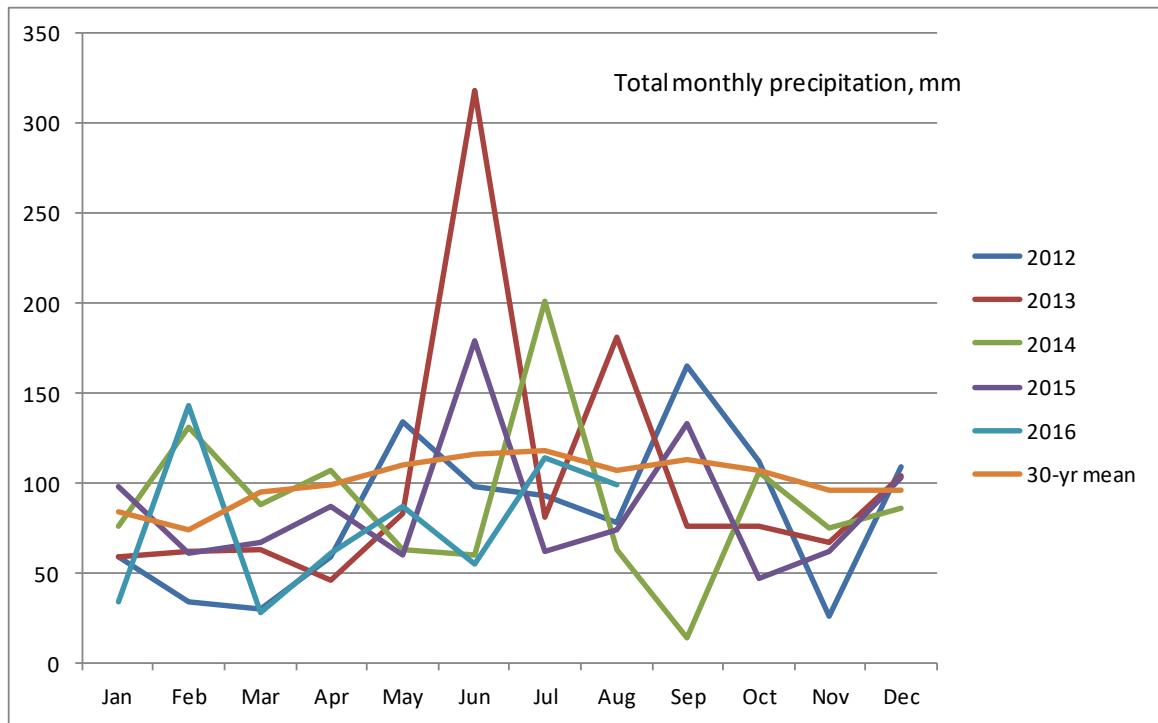

**APPENDIX E.** Weather data from nearest weather station, Jan 2012-Aug 2016, obtained from [www.ncdc.noaa.gov](http://www.ncdc.noaa.gov).

**FIGURE E1.** Monthly mean temperature and monthly mean maximum temperature over the study period. Bog turtle active season is April–October.

**FIGURE E2.** Total monthly precipitation over the study period. Bog turtle active season is April–October.
