

SUPPLEMENTAL INFORMATION

VARIATION IN COLD TOLERANCE OF NORTHERN EDGE POPULATIONS OF THE COMMON HOUSE GECKO

(*HEMIDACTYLUS FRENATUS*)

SHAN-DAR TAO AND MAMORU TODA

The following material is provided by the authors and was not subjected to review or editing by *Herpetological Conservation and Biology*.

Table S1. Individuals captured, snout-vent length (SVL) and Body weight of *Hemidactylus frenatus* in urban (UA) / rural (RA) sites on three islands.

Island / Habitat	Urban	Rural
AMA_N	7M and 2F	15M and 16F
AMA_S	15M and 14F	9M and 14F
OKI_N	13M and 9F	8M and 13F
OKI_S	13M and 13F	6M and 7F
ISG	13M and 15F	13M and 16F

Statistical results of normality and variances homogeneity of our data.

Table S2. Summary of statistical results of normality and variances homogeneity of our data in climate physical measurements and cold tolerance. ADMTY indicated annual average of daily minimum temperatures; ADMTC indicated average in daily minimum temperatures of coldest month.

Variables	Normality	Variances Homogeneity
Comparison between three islands		
ADMTY	$P < 0.001$	$P < 0.001$
ADMTC	$P < 0.001$	$P = 0.029$
Comparison between urban and rural in Okinawajima		
ADMTY	$P = 0.453$	$P = 0.900$
ADMTC	$P < 0.001$	$P = 0.994$
Physical measurements		
SVL	$P < 0.001$	$P = 0.090$
M _b	$P < 0.001$	$P = 0.118$
Cold tolerance		
critical thermal minimum (CT _{min})	$P < 0.001$	$P = 0.272$

Statistical results of comparison of annual mean daily minimum temperature among three islands (1897-2021).

Table S3. Results of Pairwise Wilcox test for comparing of annual average daily minimum temperature (ADMTY) among the three islands (1897-2021). Numbers in red indicate that row temperature is higher than column; numbers in blue color indicate that row temperature is lower than column.
